

For easier access

For safe access

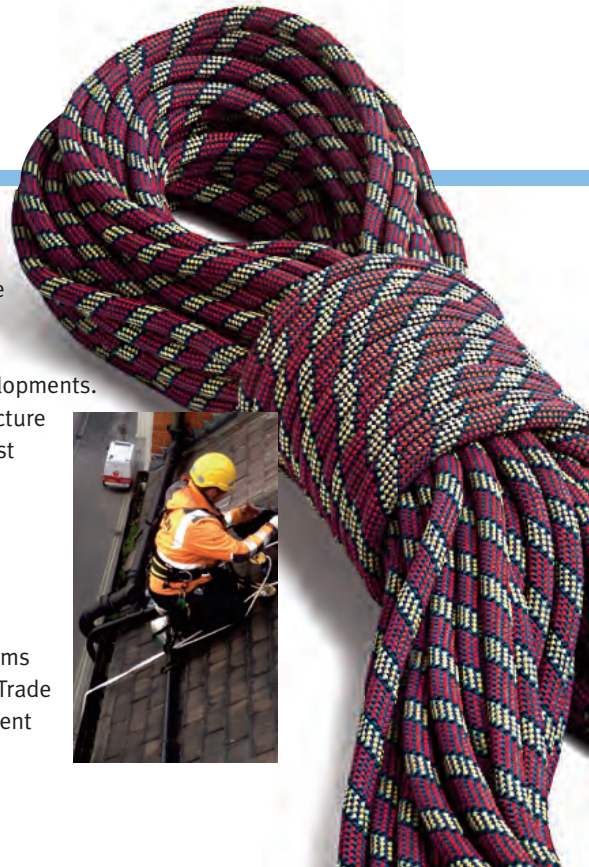

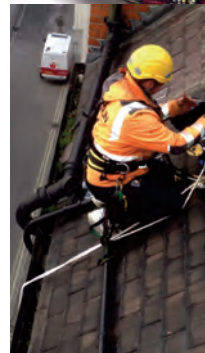

Roped access is a fast, cost effective and safe technique, and is sometimes the only viable way to reach inaccessible sites, both above and below ground. It can provide the perfect solution in busy environments where access is restricted and speed of delivery is important.

Because it avoids the likely alternatives such as cranes or scaffolding, the approach also has the considerable advantage of being quiet and discreet, so work can be carried out in occupied spaces with minimum disruption to residents, employees or the public. The ease of setting up rope systems lends itself to providing a rapid response, and we offer an emergency call-out service for unforeseen problems.

For over twenty five years Arun Construction Services Limited has been providing a nationwide service to a wide range of commercial partners including Government divisions, Blue Chip City organisations, Retail Centres and Industrial Developments. Our technical skill set and management infrastructure place us in a unique position to complete the most challenging projects.

Our teams of skilled professional operators are trained to work safely and efficiently and their expertise has earned us accreditations which underline our ability and standards. Safety is of course the highest priority. Our highly trained teams operate under the IRATA (Industrial Rope Access Trade Association) guidelines which set the most stringent standards for both equipment and methods.

For flexible access

The applications for roped access are extensive. For example, it provides a fast and efficient means of carrying out building inspections, structural surveys and site investigations, where remedial work scopes can be recommended and carried out by our team of multi-skilled trade technicians.

Safety is an increasing part of an employer's responsibility and roped access techniques enable us to comfortably and safely install systems such as eyebolts, guardrail edge protection, horizontal lifelines and vertical ladder systems that enable the client's staff to carry out maintenance with an enhanced level of safety. We provide a complete design and install service for new installations and a testing and inspection service for existing systems. All systems will be certified as fully compliant with all Work at Height Directives and the relevant British Standards.

We also offer maintenance and inspection services to ensure all systems are kept in-service and in line with Statutory Legislation.

For rapid access

Roped access is also ideally suited for high-level property maintenance such as gutter and drainage clearance, vegetation removal, painting and coatings, façade cleaning and jet washing, glass cleaning and polishing, lightning conductor inspection and many other services.

For more information about our roped access service and the advantages it could bring to your organisation, please get in touch:
